

**ABSTRACT**

A computer aided training and certification method and system is provided that also serves to control jobsite access. A hosting center/central network stores multimedia content and administrative/certification information and communicates with training units to deliver the training and instructional scripts directed to site and task specific requirements and records trainee responses to inquiries and test questions. Site access is limited to only those qualified for the purpose and satisfying mandatory pre-employment safety orientations, including testing, and/or to only those having a pre-determined purpose for entry through system generated identification cards, administrative computer tracking and/or site located electronic card readers. Individual qualification, upon entry and for use in permitting entry, is also provided for a cataloging of those individuals/employees on site and identifying those on site by the skills and tasks to which they are qualified and/or certified.
